

Top Navigation Bar (Sticky Header)

- Left / Brand: BHAVA BIOSCIENCES [Spatial-Grade Human Biospecimens]
- Center Links: Capabilities | Pre-Analytical QC | Disease Cohorts | Compliance
- Right CTA Button: [Request Cohort Feasibility] (High-contrast teal button, smooth-scrolls to the bottom form)

Section 1:

- Top Pill Tag: SPATIAL TRANSCRIPTOMICS & MULTI-OMICS COHORTS
- Headline: Spatial-Grade Human Biospecimens. Verified Quality. Delivered in Weeks not in months.
- Sub-Headline: High-plex spatial transcriptomics and proteomics assays cost thousands of dollars per slide in reagents alone. Bhava Biosciences eliminates pre-analytical failure by delivering prospectively collected human tissues and matched biofluids with controlled ischemic times, verified RNA integrity, and longitudinal clinical annotation.

Section 2: The Pre-Analytical Problem vs. The Bhava Standard

A clean comparison highlighting why generalist biobank brokers fail in spatial biology and how Bhava's direct hospital network solves it.

Quality & Operational Metric	Legacy Commodity Brokers	The Bhava Spatial-Grade Standard
Cold Ischemia Time	Unmonitored; often exceeds 2–6 hours in operating rooms.	Documented time from excision to preservation, adhering to client-defined cutoffs (including <30–45 min thresholds) .
Tissue Fixation Window	Variable (often over-fixed >48 hrs, causing irreversible crosslinking).	Standardized fixation controls (FFPE), snap-freezing (OCT), or specialized biofluid fractionation configured to your study's exact SOPs.

RNA / Molecular Integrity	Unknown; frequent degradation during library prep.	Pre-Screened Molecular Integrity: high quality samples benchmarked for RNA-profiling platforms.
Clinical Annotation	Basic demographic lines only (Age, Sex, Primary Diagnosis).	Deep Clinical Annotation: Endoscopic severity scores, DAS28, disease duration, and prior biologic failures.
Fulfillment Lead Time	3 to 6 months through multiple aggregator layers.	Delivered in Weeks via direct, high-volume tertiary hospital network integration.

Section 3: Spatial Matrices & Target Disease Cohorts

1. Available Specimen Matrices

- **Spatial-Grade FFPE Tissue Blocks:** Primary surgical resections and mucosal punch biopsies fixed under strict kinetic protocols, complete with matched adjacent normal tissue (NAT).
- **Matched Fresh-Frozen (OCT) Blocks:** Rapid snap-frozen tissue preserved in optimal cutting temperature (OCT) compound for spatial enzymatic and RNA-seq assays.
- **Matched Longitudinal Biofluids:** Fresh-frozen serum, K2-EDTA plasma, and whole blood aliquots collected concurrently to correlate spatial tissue signatures with circulating peripheral biomarkers.
- **Cellular Suspensions:** High-viability Peripheral Blood Mononuclear Cells (PBMCs) isolated via standard Ficoll-Paque separation.

2. Specialized Disease Cohorts

- **Core High-Volume Disciplines (Examples):** Gastroenterology & Autoimmune (IBD, RA), Solid Tumors (Oncology), and Chronic Inflammatory Diseases.
- **Custom Prospective Sourcing (The Broad Net):** *"Need a specialized disease cohort? Our hospital network operates across multi-specialty tertiary centers. We build custom prospective collection protocols tailored to your inclusion/exclusion criteria"*

Section 4: Institutional Compliance & Cold-Chain Governance

A horizontal trust strip featuring clean vector line icons:

- **Ethics Protocol Oversight:** Sourced under active Master Protocols reviewed and approved by CDSCO/DHR-registered Institutional Ethics Committees aligned with US OHRP/DHHS standards.

- **Donor Consent & Commercial Release:** Fully consented prospective cohorts under comprehensive Participant Information Sheets (PIS) and Informed Consent Forms (ICF) explicitly granting commercial research rights and cross-border research use.
- **Double-Blind De-Identification:** 100% de-identified via unique alphanumeric tracking codes. Zero Protected Health Information (PHI) leaves source hospital sites (fully HIPAA and DPDPA 2023 compliant).
- **IATA Cold-Chain Logistics:** Temperature-logged international air transit with real-time temperature verification.

Section 5: Cohort Feasibility Intake (Lead Generation Form)

- **Section Header:** Start Your Spatial Cohort Feasibility Request
- **Sub-Headline:** Define your study specifications. Our scientific team will assess hospital network capacity and deliver a feasibility assessment and pricing report within 48 business hours.

Form Layout:

1. **Full Name & Academic / Corporate Title** (*Text input*)
2. **Work Email** (*Email input — validation for .com, .edu, .org*)
3. **Company / Academic Institution** (*Text input*)
4. **Primary Spatial Platform / Assay Planned** (*Dropdown options*):
 - GeoMx DSP (NanoString / Bruker)
 - CosMx SMI (NanoString / Bruker)
 - 10x Genomics (Xenium / Visium)
 - Akoya PhenoCycler / CODEX
 - Other Spatial Transcriptomics / Proteomics
5. **Disease Indication of Interest** (*Dropdown: Gastroenterology / IBD, Rheumatology / Autoimmune, Oncology, Other*)
6. **Specimen Matrix Required** (*Multi-select checkboxes: FFPE Tissue Blocks, Frozen / OCT Tissue, Matched Serum/Plasma, PBMCs*)
7. **Study Specifications** (*Text area: "Target subject count, required clinical severity scores, prior medication inclusion/exclusion criteria"*)
8. **Primary Button:** [\[Submit Feasibility Request\]](#)
